

Test Management Workflow (STLC)

Standard Quality Assurance & Testing Lifecycle Guide

Step 1: Requirement Analysis

Goal: Understand what needs to be tested.

- Review the PRD or User Stories to identify testable requirements.
- Traceability: Map requirements to unique IDs (e.g., REQ-01).

Step 2: Test Planning

Goal: Define the strategy.

- Create a Test Plan specifying Scope, Resources, and Tools (Jira, TestRail).
- Define entry/exit criteria and schedule milestones.

Step 3: Test Case Development

Goal: Create the detailed "How-To" for testing.

- Write test cases with Pre-conditions, Steps, and Expected Results.
- Assign Priority (High/Medium/Low) to help track critical path items.

Step 4: Environment Setup

Goal: Prepare the laboratory.

- Configure QA Environment separate from Production.
- Initialize test data and standard user accounts.

Step 5: Test Execution

Goal: Run the tests and record results.

- Perform manual steps or trigger automation scripts (Playwright).
- Status: Mark cases as Passed, Failed, Blocked, or Skipped.

Step 6: Defect Management (Bug Tracking)

Goal: Fix discovered issues.

- Log Bug Reports with screenshots and reproduction steps.
- Once fixed, Re-test and perform Regression Testing.

Step 7: Test Closure & Reporting

Goal: Final evaluation.

- Generate a Test Summary Report (TSR) with pass/fail metrics.
- Provide "Go/No-Go" recommendation for the release.

Common Tools Used

Category	Popular Tools
Management	Jira + Xray, TestRail, Zephyr, Azure DevOps
Automation	Playwright, Selenium, Cypress, Appium
Defect Tracking	Bugzilla, Jira, Mantis
Reporting	PowerBI, Excel, Allure Reports

Best Practices

- Early Involvement: Review requirements before development.
- Maintenance: Regularly update test cases as features change.
- Documentation: Always attach proof to failed results.
